Dr. Henry L. Taylor  
Laboratory of Physiological Hygiene  
University of Minnesota  
Minneapolis 14, Minnesota

Dear Henry,

Having just returned from a conference with the anatomist here, I withdraw what I said yesterday about intercostal venous drainage. In essence most of it ultimately winds up in the SVC--plus drainage from serratus, sternocleidomastoideus and other accessory muscles which may operate during violent respiration. I'll take a crack at limiting calculations, send you a copy, and then let you ponder this new horror you have introduced.

Sincerely,

*Larry*
