Dear Henry,

29 September 1982

This is just to say how nice it is to see our association continued in the new edition of the WHO manual. The first edition proved remarkably useful, and I hope that the second will follow suit.

I feel great sympathy for the MRFIT investigators in the rather negative outcome. In its scientific conduct it was a splendid study, and it must be a bit of disappointment that the behavioural changes in the controls and the low incidence rate so reduced its power. I thought that the JAMA report, and Steve Hulley's presentation in Barcelona were commendably clear and honest.

Yours,

Geoffrey Rose
