In this issue:
- The Health of Incarcerated Individuals
- Pregnancy and Parenting Support for Women in Prison
- Mandatory Pregnancy Testing of Incarcerated Women: Is it Constitutional?

...and more!
LETTER FROM THE EDITORS

We have written Healthy Generations for 15 years. This issue epitomizes the challenges and the rewards of producing this publication. We are always challenged to balance depth with breadth. We often tackle tough topics that are not easily presented in brief articles and we necessarily discard more information than we provide. We also always face a tension between our desire to highlight innovative MCH/public health programs and our need to disseminate evidence-based information. In recent years, we have chosen to profile promising and theoretically sound programs, even if they have not been definitively evaluated.

Producing Healthy Generations also offers many rewards. The most important reward—and the most lasting—is the collaborations we form. In this volume, you will see a rich collection of multidisciplinary authors and interviewees who we have had the pleasure of meeting through our involvement in a Minnesota legislative advisory committee and through an institute we held on the reproductive health of incarcerated women in October 2014 (both are discussed in this volume). Collectively, our many collaborators are sending a message to our readers: it is complicated, and necessary, to provide comprehensive health services to the more than two million incarcerated people in the US. No one involved in this volume has shirked from such complications. Every one of our collaborators—the dedicated legal and criminal justice professionals, as well as the innovative national research experts in the health of incarcerated women—are committed to serving the health needs of incarcerated people. They highlight the importance—and the possibility—of effective criminal justice and public health collaborations to address the health of an extraordinarily vulnerable and largely underserved population.

Healthy Generations: Incarceration and Public Health

Executive Summary
Winter 2015

Adult Incarceration in the United States
The US maintains the highest incarceration rate in the world. About 1 in 35 US adults are under some form of supervision.

This population consist of socially, physically, and mentally vulnerable citizens. Incarcerated individuals are disproportionately non-white and likely to be arrested again. Incarceration not only affects the person in jail or prison, but it also their families, often contributing to an intergenerational cycle of inequality.

Table 1. Characteristics of Incarcerations Sites

<table>
<thead>
<tr>
<th>Site</th>
<th>Jurisdiction/Administration</th>
<th>Status of Incarcerated Individual</th>
<th>Typical Length of Stay</th>
</tr>

Health of Incarcerated Individuals
Compared to the general population, people who have experienced incarceration often have poorer health.

Data for state, federal and jail inmates show that:

- 5-10% were homeless before incarcerations;
- Two-thirds to three-quarters were unemployed in the month before arrest;
- 10-25% had histories of physical or sexual abuse;
- 30-50% had ever received public assistance while growing up;
- 6-18% had lived in foster homes as children; and
- 20-40% experienced abuse from a parent or guardian as a child.

Unfortunately, many individuals continue to have unmet physical and mental health needs while incarcerated. While US facilities must provide health care, services often vary across facilities.

Incarceration could provide opportunities for screening, treatment, and a healthy environment. But, individual’s release and return to troubled communities and limited socioeconomic opportunities, further increasing their risk for poor health outcomes.
LEGISLATION REGARDING PREGNANT INCARCERATED WOMEN

Minnesota

In 2014, Minnesota’s legislature unanimously passed the state’s first law that considers the unique needs of incarcerated pregnant and postpartum women (SF2423/HF2833).

The bill addresses;
- The use of restraints with pregnant and postpartum women;
- Pregnancy and STI testing;
- Access to educational materials;
- Mental health assessments and treatment;
- Access to doulas (professionals who provide non-medical support before, during, and after delivery).

HEALTH CARE FOR PREGNANT INCARCERATED WOMEN

- 3-5% of incarcerated US women are pregnant at intake.
- A 2009 National Survey of Women’s Correctional Facilities’ health practices for pregnant inmates found inconsistencies in the health practices across facilities.
- The 2009 survey also found that many facilities did not adhere to national recommendations regarding health care for incarcerated pregnant women.

OPTIONS FOR CARE OF PREGNANT WOMEN AND THEIR CHILDREN

Prison Nursery Co-residence and Re-entry

Prison nurseries offer an opportunity for incarcerated mothers to live with and care for their infants for a period of time. In facilities without nurseries, like the state prison in Minnesota, mothers are typically separated from their infants a few days after birth. There are currently nine prison nurseries in other states in the US.

The William & Mary Healthy Beginnings Project

The William and Mary Healthy Beginnings Project is an intervention and research program that works with local jails in Virginia to improve pregnancy outcomes of incarcerated women.

Isis Rising: Pregnancy and Parenting Support for Women in Prison

Isis Rising is a non-profit program that provides a 12-week pregnancy and parenting support group and doula care to inmates housed at the Minnesota Correctional Facility-Shakopee.

CHALLENGES OF WORKING IN THE CONTEXT OF INCARCERATION

Researchers experience significant challenges in corrections settings, including institutional regulations, safety issues, and physical and logistical constraints.

Collaboration among research, corrections, community stakeholders, and policy enacted at local and state levels are the best ways to overcome these challenges.
